

# theGuard! ApplicationDashboard

## New challenges for your IT management

Service-oriented architectures, the ever-increasing complexity of IT environments, and growing cost pressure present new challenges for IT management today.

Monitoring IT environments using monitoring systems alone is no longer enough. Today's system management software must deliver sophisticated root cause analysis capabilities which in turn enable efficient error recovery.

Advanced visualization options ease root cause analysis

## Precise analysis within seconds

You can easily combine any of the available charts, arrange them in the order you want, and thus create a dashboard that is tailored to fit. This function allows for the precise interpretation of performance data and the creation of trend analyses. Virtually any requirement placed on IT management today can be satisfied.

Thanks to sophisticated visualization techniques, it only takes seconds to display large volumes of data in theGuard! ApplicationDashboard: highlighting, zooming, and drill-down functions allow for a fast online analysis and ease the root cause analysis in case of performance problems. This increases system stability and availability.

## Details

Using drag and drop, users can customize their dashboard by choosing from a variety of chart types or simply use one of the many templates available.

The real-time data collected by theGuard! ApplicationManager can be displayed in charts in any desired combination. The selected period can be freely defined and range anywhere from a few minutes to several years.

Powerful zooming and drill-down functions enable users to display minute values even when working with yearly charts – all with just a few clicks of the mouse.

## REALTECH solution

Faster analysis and more comfortable visualization options on the basis of modern UI technologies are approaches that significantly accelerate the process of root cause analysis in complex system environments.

The newly developed theGuard! ApplicationDashboard meets all of these requirements. Users benefit from a modern platform based on .NET technology that allows them to conduct online analyses of performance and events. The real-time values collected and the events generated by theGuard! ApplicationManager are presented graphically in a console that can be configured to suit your needs.
